

Final Stakeholders and Elicitation Methods

This document records the final stakeholder list for the Software Design Diagram Generator (SDDG) and the elicitation method used for each stakeholder. The list is the one submitted in Lab 6 (S1–S5); each stakeholder is also mapped to the system role it holds in SRS v2.0 (Viewer, Editor, Owner, System Administrator).

Each stakeholder card lists its type, its role, the methods used to elicit its needs, what was gathered and the current status. The elicitation methods are described on their own cards after the stakeholders. The services and standards that appeared in earlier stakeholder lists are recorded at the end, together with the constraint or domain requirement each one became.

1. Stakeholders

S1 — Software Developer / Engineer

Stakeholder type: Primary end user

Role in the system: Uses requirements to generate and inspect design diagrams.

System role (SRS v2.0): Editor or Owner of a project

Elicitation methods: EM1 Questionnaire (Google Form); EM4 Semi-structured interview (conditional)

What was gathered:

- Pain points: diagramming is time-consuming, hard to translate requirements into elements, hard to keep consistent with changing requirements.
- Preferred inputs: typed/pasted text, PDF/DOCX SRS, user stories, FR/NFR lists and multiple documents.
- Generated diagrams are treated as drafts or starting points that must be reviewed and edited.
- Expected editing: add/remove, move, rename, edit relationships, regenerate selected parts or the whole diagram.

Status: Survey closed with 6 real responses (16 Sep 2026). Interview not conducted.

Requirements informed: FR1, FR3, FR5, FR12, FR13, FR14, FR16, FR17, FR18

S2 — Software Architect / Designer

Stakeholder type: Primary end user

Role in the system: Uses generated diagrams for architectural and design decisions.

System role (SRS v2.0): Editor or Owner of a project

Elicitation methods: EM1 Questionnaire (Google Form); EM2 Document analysis of UML/DFD notation standards

What was gathered:

- Diagram types needed: Use Case, Class, Activity, Sequence, DFD and Component.
- Initial priority from the survey: Use Case, Activity and Sequence.
- Notation must follow OMG UML and Gane-Sarson/Yourdon DFD conventions.
- Unsupported elements must be marked as assumptions, and every element must trace back to a requirement.

Status: Completed

Requirements informed: FR9, FR10, FR15, FR17, FR29, DR1, DR2

S3 — Project Manager / Team Lead

Stakeholder type: Secondary user

Role in the system: Uses diagrams and requirement information for planning, review and communication.

System role (SRS v2.0): Owner of a project (Owner-only features FR20–FR22)

Elicitation methods: EM3 Internal team brainstorming (facilitated by the Product Owner / Team Lead)

What was gathered:

- Need a project-level coverage summary and a shareable combined report.
- Need an activity log showing who changed requirements and diagrams, and when.
- Need to invite collaborators and assign roles.

Status: Completed; decisions recorded in the Conflict & Decision Log v2.0

Requirements informed: FR20, FR21, FR22, FR24, NFR10

S4 — System Administrator

Stakeholder type: Administrative stakeholder

Role in the system: Manages users, system configuration and access where applicable.

System role (SRS v2.0): System Administrator (global role)

Elicitation methods: EM3 Internal team brainstorming; EM2 Document analysis of AI provider and hosting documentation

What was gathered:

- Account management: view, add, deactivate and reactivate accounts.
- Monitoring: active users, projects, storage against limits, error logs, generation-time statistics.
- Free-tier AI provider and hosting limits that the system must handle (rate limits, backend sleep, storage cap).

Status: Completed

Requirements informed: FR23, FR25, FR27, FR30, NFR7, NFR9, C1–C3

S5 — Development Team

Stakeholder type: Development stakeholder

Role in the system: Builds, tests, maintains and evolves the system.

System role (SRS v2.0): Not a runtime role; the team builds and maintains the system

Elicitation methods: EM3 Internal team brainstorming; EM2 Document analysis of course instructions and the Lab 6 brief

What was gathered:

- Project-specific interpretation of the brief, feasibility and prioritisation into four sprints.
- Technology constraints: Gemini free tier, Vercel frontend, Render backend, free-tier storage and email.
- Scope decisions such as English-only input, no OCR, and Activity diagram in place of a separate flowchart.

Status: Ongoing; recorded in meeting minutes and the Conflict & Decision Log v2.0

Requirements informed: Scope (SRS §1.2), C1–C5, NFR6, NFR8

2. Elicitation Methods

EM1 — Questionnaire / Google Form

Applied to: S1 Software Developer / Engineer, S2 Software Architect / Designer (students and developers)

Format: Online Google Form shared via Slack

Owning sub-team: Requirements/Docs

What was gathered:

- 6 real responses (all undergraduate students), plus a synthetic set of 15 example profiles used while real responses came in.
- Ambiguity handling: ask for clarification, highlight the requirement and explain why it was flagged.
- Change propagation: most respondents want related diagrams updated after confirmation.
- After generation: explanation of derivation, traceability, list of assumptions, validation warnings.
- Acceptable generation time: mostly 10–60 seconds.
- Security: login, encrypted transfer/storage, limited retention of documents.
- Export: PNG, SVG, PDF, editable XML and PlantUML.

Status: Completed

EM2 — Document Analysis

Applied to: Course instructions and Lab 6 brief (S5), UML/DFD notation standards (S2), AI provider and hosting documentation (S4)

Format: Async, individual review

Owning sub-team: Requirements/Docs (course material), DFD Renderer (notation), AI/Extraction (AI provider), App Shell/Infra (hosting)

What was gathered:

- Required deliverables, terminology and course constraints.
- Notation rules for each diagram type (DR1).
- AI provider rate limits and terms, hosting sleep behaviour and non-persistent disk (C1–C3).

Status: Completed

Source: Elicitation Application Plan; Lab 6 submission §3

EM3 — Internal Team Discussion / Brainstorming

Applied to: S3 Project Manager / Team Lead, S4 System Administrator, S5 Development Team

Format: One combined in-person or Slack huddle session, facilitated by the Product Owner / Team Lead

Owning sub-team: Whole team

What was gathered:

- Interpretation of the brief, feasibility and prioritisation.
- Roles and permissions (Viewer, Editor, Owner, System Administrator).
- Resolution of conflicts between requirement drafts (Conflict & Decision Log v2.0).

Status: Ongoing; decisions recorded in MOM-01 to MOM-03 and the Decision Log

Source: docs/meetings/; docs/requirements/conflict-decision-log-v2.0.pdf

EM4 — Semi-structured Interview

Applied to: An independent developer with production-level application experience (S1)

Format: In-person or call, if a slot could be arranged

Owning sub-team: Requirements/Docs

What was planned:

- Real-world workflow, maintenance, ambiguity, trust in generated output, editing and traceability.
- Security, privacy and production concerns.

Status: Not conducted. As planned, the survey, document analysis and brainstorming were used for this input instead.

Source: Lab 6 submission §3

3. Entities Removed from the Stakeholder List

Services and Standards Recorded as Constraints

Why removed: Earlier lists (MOM-02, MOM-03) included non-human entities. The final list keeps only people who use, manage or build the system; these entities now appear as constraints and domain requirements.

Mapping:

- LLM API Provider (Google Gemini) → Constraint C1, FR30, NFR5 (EM2 Document analysis, AI/Extraction sub-team).
- Version Control & Hosting Provider (GitHub, Vercel, Render) → Constraints C2, C3 (EM2 Document analysis, App Shell/Infra sub-team).
- UML/DFD Notation Standards Body → Domain requirement DR1 (EM2 Document analysis, DFD Renderer sub-team).
- Course Instructor / Client → scope and deliverables; elicited through EM2 Document analysis of course instructions.
